← Back **Week 2 Quiz - Design**
Graded Assignment • 20 min

Due Mar 16, 11:59 PM CET

1. What is the cycle of the iterative design process? — 1 point

- ○ Requirements - Development - Release
- ○ Design - Analysis - Testing - Refinement
- ◉ Requirements - Design - Development - Testing
- ○ Design - Analysis - Coding - Testing

2. What's the difference between system centered design and user centered design — 1 point

- ◉ System centered design is focused on what is easy to build on a platform while user centered design is focused on user needs and context.
- ○ System centered design focuses on developing systems while user-centered sign focuses on developing user tasks.
- ○ System centered design is about analyzing systems but user centered design is about analyzing users

3. Which of the following are NOT good ways to incorporate user-centered design in the design of security systems? — 1 point

- ◉ Designing security based on what experts believe is best.
- ○ Designing security around user tasks
- ○ Designing security based on the user's environment and work context

4. When designing error messages, which are important factors to keep in mind for usability? — 1 point

- [x] Use language that users will understand
- [x] Make the most secure options part of the user's natural task
- [ ] Use technical terms to fully explain the message to users
- [ ] Force users to approve security exceptions
- [x] Provide users with clear exits to get out of a security warning

5. If you were designing security for the entrance to a secure facility, which of the following should you consider? — 1 point

- [ ] Which algorithms are most efficient
- [x] How often users enter and exit
- [x] What tasks the users are in the middle of when they need to access the area.
- [ ] What programming libraries are easy to use and freely available

6. Which of the following are disadvantages of personas? — 1 point

- [ ] They are expensive and time-consuming to create
- [x] A diverse audience may be difficult to represent with a normal-sized set of personas
- [x] Too many personas can be difficult to create and manage.
- [ ] All team members work with a consistent model of users
- [ ] They make potential users too "real" for designers

7. Which of these are advantages of low-fidelity (e.g. paper) prototypes — 1 point

- [ ] They let designers see the impact of font size, color, and other visual elements
- [x] Any team member can create one, regardless of programming skills
- [x] They can be created quickly and cheaply
- [ ] They can be used to calculate how long it will take users to accomplish certain tasks

8. Which of the following are present in good interface design? — 1 point

- [ ] Encryption of all data transmitted on a network
- [x] Relies on common interaction techniques for familiarity
- [x] Easy to recover from errors
- [x] Minimal training needed for a person to use the system

9. Which of the following is NOT an important part of the design process — 1 point

- ◉ Compute the efficiency of the underlying algorithms
- ○ Consider usability guidelines
- ○ Prepare a prototype
- ○ Solicit user input

10. In participatory design and co-design, which of the following is true — 1 point

- ○ Users design the system on their own based on a list of constraints provided by designers
- ○ Designers brainstorm and create prototypes after asking potential users questions
- ○ Managers convey input from users to designers
- ◉ Average users have equal standing with designers
