← Back **Week 3 Quiz - Evaluation**
Graded Assignment • 30 min

Due Mar 18, 11:59 PM CET

1. What is the goal of A/B testing? 1 point

- ○ To create software and release it in version A, refine and release version B, and so on
- ○ To allow users to choose interface options from a menu
- ◉ To compare the performance two (or more) interface variations
- ○ To test users' answers to quiz questions

2. What is a heuristic evaluation? 1 point

- ○ Developing a description of an example user and thinking about how he or she might use the system
- ○ Having users test a system with low-tech paper prototypes
- ◉ Analyzing a system according to a set of guidelines for good usability.
- ○ Presenting a description of a system of a group of representative users

3. What is the goal of a usability study? 1 point

- ◉ To measure and describe usability of a system for given tasks
- ○ To study the theoretical aspects of usability
- ○ To develop new measures of usability
- ○ To test the security of a system

4. If we ran an experiment to test if password logins were faster than a voice recognition authentication system, what would be required to show passwords were faster? 1 point

- ○ The average login time for password users was lower than for voice recognition users
- ○ The users of the password group reported higher satisfaction on surveys than the voice recognition group
- ○ Password users remembered their passwords more easily than voice recognition users remembered how to authenticate
- ◉ Statistical tests showed that the password group logged in significantly faster than the voice-recognition group.

5. Which of the following is not something you would do when running a controlled experiment to evaluate an interface? 1 point

- ○ Provide users with training and instructions on how to use the control and experimental interfaces
- ○ Have some people try using the control interface while other people try using the experimental interface
- ○ Have each person in the experiment try both interfaces.
- ◉ Select average users to test the control interface and expert users to test the experimental interface.

6. Qualitative evaluation is intended to: 1 point

- ◉ Understand user experiences and reactions to a design
- ○ Measure how well a user remembers the steps required to complete a task
- ○ Time how long it takes a user to complete a task
- ○ Count the number of errors a user makes when using the system

7. Which of the following is NOT a standard observation method 1 point

- ○ Constructive Interaction
- ○ Silent Observer
- ○ Think Aloud
- ◉ Assisted Use

8. Why do we conduct usability studies on systems that have already been designed? 1 point

- ○ Users often make ignorant mistakes. A usability study will show areas in which users need better training.
- ○ A usability study will show how much users like a system and that can help companies set the price for their software
- ◉ Despite their best efforts, designer and developers cannot know exactly how users will interact with their system. A usability study will find previously uncovered errors.

9. Which of the following are typical questions to ask on a pre-test questionnaire? 1 point

- ☐ How difficult was it to complete task 1
- ☑ What is your age
- ☐ What was most challenging about using the interface
- ☑ What is your highest level of education

10. When conducting a controlled experiment, which of the following is not part of the process 1 point

- ○ Design and test the experimental protocol
- ◉ Explain to participants what conclusions you hope to draw from the results
- ○ Identify dependent and independent variables
- ○ State a lucid hypothesis
