← Back **Week 4 Quiz - Guidelines for Usable Security**
Graded Assignment • 30 min

Due Mar 20, 11:59 PM CET

1. What is the principle of least privilege? — 1 point

- ○ Users are given limited administrative privileges in a secure system
- ○ The least privileged users are not allowed to use a secure system
- ◉ A system should be able to access only the information it needs to perform its functions

2. Which of the following is not a guideline for creating usable security systems? — 1 point

- ◉ Prevent users from granting authority unless their request is approved by the security staff
- ○ Make sure that users know what authority they have granted and what that means for security decisions
- ○ Make sure users know what authority they hold
- ○ Create interfaces that make it clear what software the user is interacting with and providing information to.

3. Which of the following is a good guideline about showing detail to users? — 1 point

- ○ Show users a much technical detail as possible so they can make an informed decision
- ◉ Show a level of detail that's informative and useful to the user, and no more than that
- ○ Withhold all details from users because it will only confuse them

4. If you are warning users about a security problem that has been detected, which is the best message to show them? — 1 point

- ○ A detailed technical description of the error so the user can make the most informed decision about what action to take.
- ◉ A message that alerts them to the error and makes the most obvious option the one that stops the user from proceeding. A small link is given to ignore the warning and proceed.
- ○ A subtle message at the top of the page that a user can see but that will not interrupt their workflow.

5. In a system where a person can grant authority to others to his or her own access resources, which of the following is true? — 1 point

- [x] The easiest way to do a task should require the most minimal granting of authority
- [x] Users should be able to reduce the authority granted to others
- [x] The interface should help users be aware of what authority they have granted in the past
- [ ] Authority should be granted without requiring the user to explicitly give consent

6. True or False: A design guideline for creating usable secure systems is to make the most secure way to complete a task the easiest way to complete the task. — 1 point

- ◉ True
- ○ False

7. For an average user, which of the following is the most usable way to set file permissions? — 1 point

- ○ A graphical user interface menu with options the user, group, and global permissions, next to which a user can check boxes labeled "r", "w", and "x" to grant permission
- ○ unix command line based access using the chmod command
- ◉ A pop up menu that allows a user to select a document as "private", "shared with select users", or "public". If one of the latter two options are selected, the user is then prompted to select "others can read" or "others can edit"

8. Which guideline is violated when an interface does not make capitalization differences unambiguous (e.g. a lower case "L" and capital "I" appear to be the same thing) — 1 point

- ◉ Make it easy to see the differences between objects and actions that could be confused.
- ○ Make it easy for users to control access to their resources
- ○ Show a level of detail that's informative and useful to the user, and no more than that

9. True or false: Users should be aware of what authority they hold, what authority they have granted, and what the implications are for security decisions — 1 point

- ◉ True
- ○ False

10. Which of the following is true? — 1 point

- ○ The more usable a system is, the less secure it is because users do not understand security, so to make a usable system, security must be downgraded or left off.
- ◉ The more usable a system is, the more secure it is because usable systems help users make good security decisions and easily choose the most secure actions
